?HTML

HyperText Markup Language is the standard markup language used to create web pages.

Written using tags enclosed in angle brackets

`<html>` called opening tag

`</html>` called closing tag

Server vs. Client

Servers give out information (.com's)

Clients read in the information (web browser)

These can be compartmentalized, services can be both servers and clients

you log into facebook, [facebook = server]

facebook asks spotify for info [facebook = client]

Document Object Model

Its transforms your html file from plain text into what you see in browser

web inspector is what interacts with the DOM

Web Inspector

Use it to manipulate the HTML and CSS of current webpages to see, changes that you make (right click inspect element)

Content / Styling

Can be handled separately
content in .html and styling in .css

article text | final paper
html | css

styling

defined using classes (.name) and IDs (#name)

classes : more general, used for a group of elements

IDs: more specific, used for 1 element

A lot of bugs come from missing notation, HTML is very relaxed as it not great at telling you where errors are or if there are bugs, it just assumes what should have been.

Use the web inspector to help debug and understand the hierarchy, that makes up HTML files

cleaning and clarifying code

delete unwanted resources and code
have few files (one css file)

browsers load files linearly
be consistent

72dpi is plenty for the web
make images the size you want to display them

PNGs are good for images
SVGs for things like logos

optimize your images: imageoptim(mac) xnview(win)

use camelCase for file names

good design is all about
making other designers feel
like idiots because that idea
wasn't theirs.

 #Design

staring at a computer screen
until your eyes bleed

Web vs. Paper

web is interactive and has to work on many different devices and internet speeds and lots of constantly changing elements

where on paper the constraints are constant

<http://iampaddy.com/lifebelow600/>

Prototype Iterate

How the customer explained it

How the project leader understood it

How the engineer designed it

How the programmer wrote it

How the sales executive described it

How the project was documented

What operations installed

How the customer was billed

How the helpdesk supported it

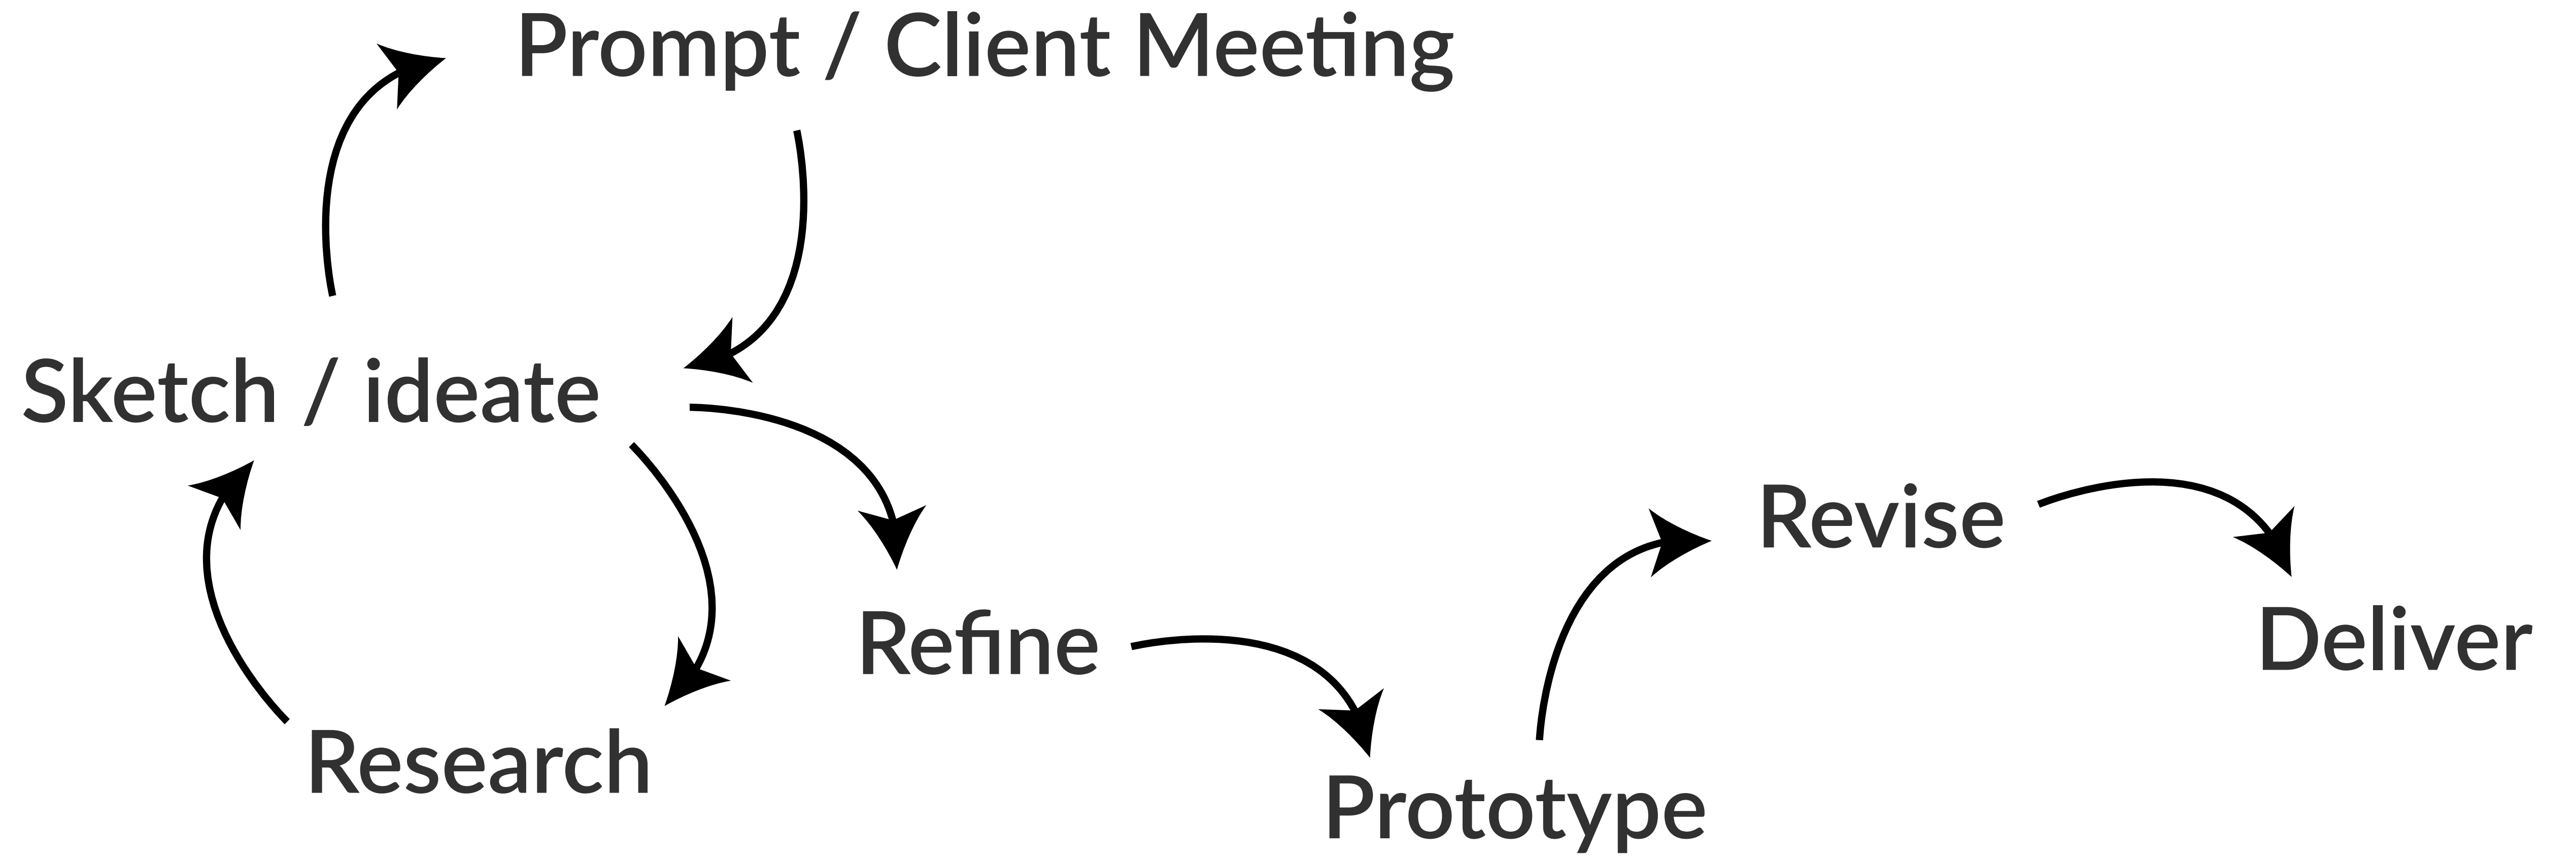

What the customer really needed

“Good design is not about what medium you’re working in. It’s about thinking hard about what you want to do and what you have to work with before you start.”

-Susan Kare

Principles

CONTRAST

Unique elements in a design should stand apart from one another. One way to do this is to use contrast. Good contrast in a design – which can be achieved using elements like color, tone, size, and more – allows the viewer's eye to flow naturally.

To the left, you can see 4 ways to create contrast in your design.

ALIGNMENT

Proper alignment in a design means that every element in it is visually connected to another element. Alignment allows for cohesiveness; nothing feels out of place or disconnected when alignment has been handled well.

PRINCIPLES of DESIGN

quick reference poster

REPETITION

Repetition breeds cohesiveness in a design. Once a design pattern has been established – for example, a dotted border or a specific typographic styling – repeat this pattern to establish consistency.

The short version?

Establish a style for each element in a design and use it on similar elements.

PROXIMITY

Proximity allows for visual unity in a design. If two elements are related to each other, they should be placed in close proximity to one another. Doing so minimizes visual clutter, emphasizes organization, and increases viewer comprehension.

Imagine how ridiculous it would be if the proximity icons on this graphic were located on the other side of this document.
